

Prahlín Portfolio Work Log - July 20, 2026

Compiled summary for Monday, July 20, 2026 - focus: continuing the Prahlín Portfolio landing-page polish after the July 19 identity pass, rebuilding the green hero carousel CTA with project-specific name stacks, device frames, platform-logo image assets, social-button treatments, revised hero and proof copy, static-export validation, a new Cinerific case-study route that mirrors the Alla Vostra page structure, empty Android tablet device frames for later Cinerific content, refreshed project snapshot context, successful GitHub Actions deployment checks, and generation of the daily Portfolio PDF worklog.

Generated in continuity with the established Prahlín Portfolio daily worklog cadence: compact opening summary, source-material section, baseline section, goal list, work-completed sections, validation section, files-touched list, follow-up context, and output-artifact close.

This artifact intentionally covers only Prahlín/portfolio work performed for July 20, 2026: the source snapshot refresh, review of every pre-existing Portfolio worklog PDF, the landing-page and carousel work represented by commit `eee650f84b6ab8988055258ea33869d8ce7e98f5`, the dedicated Cinerific page work represented by commit `0128d3a6607d7044c19c41c923c9f4c2ed16bf85`, local validation checks, Hostinger static-export workflow confirmation, and this worklog-generation step. Alla Vostra, Credit King, and Cinerific application repositories were not changed for this record.

Source Materials Reviewed

- Ran `./read_project.sh` from `/Users/prahlin/gh/portfolio` and regenerated `portfolio_PROJECT_SNAPSHOT.txt` before writing this worklog, preserving the project convention that Codex reads the current source snapshot before continuing Portfolio work.
- Reviewed the refreshed `portfolio_PROJECT_SNAPSHOT.txt`, including project notes, current source tree, app source dumps, root/tooling/deployment configuration, public asset inventory, PDF worklog inventory, git context, and the standing instruction to ask for a commit message before committing or pushing.
- Reviewed every pre-existing Portfolio root-level worklog PDF: `portfolio_worklog_july11.pdf`, `portfolio_worklog_july14.pdf`, `portfolio_worklog_july15_part1.pdf`, `portfolio_worklog_july15_part2.pdf`, `portfolio_worklog_july16.pdf`, and `portfolio_worklog_july19.pdf`.
- Extracted text from the existing Portfolio PDFs with `pdftotext` to preserve the same title cadence, opening summary density, section order, bullet-heavy technical voice, validation language, files-touched list, follow-up context, and output-artifact close.
- Checked PDF metadata and page counts with `pdftotext`. The mature Portfolio worklogs use letter-size pages, root-level filenames, compact five-to-six page bodies, and Codex standard-library PDF-generator metadata.
- Reviewed current Git history and confirmed the July 20 implementation scope through `git log`, `git show --stat`, `git show --name-status`, targeted diffs, and the final `HEAD/origin/main` match at `0128d3a6607d7044c19c41c923c9f4c2ed16bf85`.
- Reviewed the committed landing-page source state from `eee650f`, whose subject summarized the user-approved hero CTA, icon-frame, social-button, proof-panel, and copy refinements.
- Reviewed the committed Cinerific source state from `0128d3a`, whose subject recorded the new Cinerific case-study route and the empty tablet-frame treatment copied from the Alla Vostra layout pattern.
- Checked local preview responses from `http://127.0.0.1:3000/` and `http://127.0.0.1:3000/projects/cinerific`, including 200 responses from both routes after the static-build validation pass.
- Checked GitHub Actions run history with `gh run list` and confirmed the Build static export for Hostinger workflow completed successfully for both July 20 commits.

Baseline Status Before July 20 Work

- The July 19 Portfolio landing page already had the Prahlin brand restored, a green/black visual system, an Alla Vostra case-study route, updated proof stats, a proof-panel card, and project-carousel labels with basic platform icons.
- The green hero carousel still needed close visual tuning: the project label text, category text, platform icon placement, icon sizes, arrow treatment, animation direction, and mobile-width behavior were still being judged live against the local preview.
- The project CTA still used generic App wording and later View-prefixed wording before settling into a left-aligned composition with View, Project, colored project name, black category text, platform frames, and a stroked arrow.
- The Android, iOS, and web icons were still inline CSS/SVG treatments that needed repeated sizing, stroke, fill, spacing, and device-frame tuning to match the desired miniature-device look.
- The GitHub button remained the only secondary social button and did not yet have the paired LinkedIn treatment, icon box parity, white GitHub background, or enforced row break below the green project CTA.
- The hero lede, stack chips, and proof panel still carried July 19 wording that needed to be changed to the newer Original Vision, UI/UX Design, Front-End Logic, Back-End Support, EAS, GGL Play, and App Store language.
- Cinerific was still only represented on the landing page as a project card and carousel state; there was no dedicated /projects/cinerific case-study route to receive clicks from the card or green button.
- The intended Cinerific case-study page needed to preserve every existing Alla Vostra layout section and content rhythm while replacing phone screenshot frames with empty landscape Android tablet frames for later screenshots and corrected project copy.

Goals for July 20

- Finish the green hero carousel CTA as a reliable, mobile-friendly project button whose width stays consistent across projects while preserving left-aligned internal content.
- Replace generic CTA wording with project-specific project-name stacks and categories while keeping text style, stroke, color contrast, and spacing consistent with the rest of the hero UI.
- Create reusable device-frame treatments for phones and tablets, keep their interiors transparent or empty as requested, and place Android/iOS image logos inside matching frames whenever those platform logos appear.
- Keep the Android and iOS logo artwork visually consistent by converting the phone-frame versions into reusable SVG image assets rather than continuing to manually redraw slightly different icon shapes.
- Add a paired LinkedIn social button beside GitHub, match button dimensions, tune icon boxing, and force both secondary buttons onto the line below the green project CTA across desktop and mobile layouts.
- Update stack-chip and proof-panel terminology to better match the user actual experience and requested wording, including Node.js, Next.js, Tailwind CSS, Jetpack Compose, EAS, and GGL Play.
- Create a Cinerific project page that exactly follows the Alla Vostra page layout, section order, text density, and component structure while swapping screenshot-filled Android phone frames for empty landscape Android tablet frames.
- Wire both Cinerific entry points - the landing-page case-study card and the green Cinerific carousel button - to the new /projects/cinerific route.

Work Completed - Hero CTA, Project Labels, and Motion

- Changed all green carousel project buttons from App wording to Project wording during the tuning pass, then settled the visible CTA structure into View, Project, colored project name, black category label, platform frames/icons, and a large stroked arrow.
- Replaced the generic View label after user iteration so the project state shows the actual project name: Alla Vostra, Cinerific, or Credit King.
- Set Alla Vostra project-name fill to a lighter orange, Credit King to a lighter dark blue,

and Cinerific to purple while preserving the white text stroke and black outline language already used elsewhere in the CTA.

- Added category labels under the project names, using tiny solid black centered text: Restaurant for Alla Vostra, Streaming for Cinerific, and Finance for Credit King.
- Moved category labels below the colored project names instead of letting them sit to the right of the names, then tuned the font down by 1px and added a slightly larger vertical gap between name and category.
- Added and later removed the extra View-prefixed stack during live iteration, then restored the final View label without the colon and disabled animation for that static label.
- Swapped the horizontal placement of Project and the app-name stack, then renamed the visible label to View while retaining the project-name stack as the primary project-specific identity inside the button.
- Doubled the left/right gap around the app-name stack so the View label, name/category stack, and device icons read as separate pieces without making the button feel loose.
- Changed green button animation behavior so button assets slide in from the bottom rather than from the left, then preserved the user correction to disregard the later reverse-direction request.
- Adjusted the button inner alignment to prevent the left side of View from clipping, then horizontally aligned the CTA content with GitHub, React Native, and neighboring hero elements while maintaining equal button width.
- Eliminated trailing horizontal waste after the final device frame/icon and matched arrow right padding to View left padding so narrow portrait smartphones can fit the row without horizontal scrolling.
- Matched the black arrow visual weight to the View label by increasing size, giving it white fill, and applying the same black-stroked text treatment as the other CTA words.

Work Completed - Device Frames and Platform Assets

- Created a new miniature smartphone device-frame icon separate from the Android logo, based on a simplified Android Small aspect-ratio device frame.
- Scaled the smartphone frame through repeated user-directed passes: doubled its initial size, made the hollow interior transparent, widened the frame by 25%, then increased the overall scale twice by 10%.
- Placed the tiny Android and Apple icons vertically inside the phone frame, restored their white fill with black strokes after a color regression, and spread the two icons evenly within the transparent interior.
- Reduced the Android eyes by roughly 20%, then increased the Android, Apple, and web icon sizes through multiple 5% passes and a later 10% web-only pass.
- Built a separate horizontal tablet frame for Cinerific, slightly larger than the smartphone frame, without changing the existing phone-frame assets.
- Placed the Android icon inside the tablet frame for the Cinerific carousel state and matched the tablet-frame Android artwork to the phone-frame logo by replacing manual drawing with a copied reusable image asset.
- Added public/images/android-device-logo.svg as the canonical reusable Android device logo image, preserving the phone-frame look while allowing the same artwork to be placed inside the tablet frame.
- Added public/images/ios-device-logo.svg so the iOS logo also renders as a reusable image asset with the same white fill and black stroke behavior as the established phone-frame artwork.
- Changed every iOS platform appearance so the iOS logo receives its own device frame instead of sharing or floating outside a platform frame.
- Increased Android and iOS logo sizes by 10% after converting them into image assets, preserving the frame sizes and project-button layout constraints.
- Kept the web platform as a standalone globe icon for projects that also have a web surface, with sizing tuned separately from the framed mobile-platform logos.
- Ensured the icon/frame group remains compact near the arrow while still left-aligning the full internal asset cluster with the rest of the hero control row.

Work Completed - Social Buttons, Hero Copy, and Proof Panel

- Changed the GitHub button to a white background with black text while keeping it aligned below the green carousel CTA.
- Copied the GitHub button exactly and placed an identically sized replica to its right, then changed the second button text to LinkedIn.
- Replaced the GitHub-style braces on the LinkedIn button with a custom royalty-free LinkedIn-style icon, enlarged it by 50% and later by another 20%, and tuned the icon color relationship through user-directed blue/light-blue swaps.
- Matched the LinkedIn icon stroke to the black-stroked green-button typography only around the image borders, then added hairline black strokes to the i, n, and i-dot shapes themselves.
- Turned the entire LinkedIn button light blue and preserved enough contrast between the blue button, the icon box, and the icon letters for the button to remain legible beside the white GitHub button.
- Added an identically sized bordered icon box around the GitHub braces, nudged the braces closer to the middle, and made the braces bold so the GitHub mark visually balances with the LinkedIn mark.
- Forced a line wrap after the green carousel CTA so the GitHub and LinkedIn buttons always appear on the line below it on desktop, mobile, portrait, and landscape viewports.
- Changed the hero lede from the July 19 cross-platform release sentence to Original Vision + UI/UX Design + Front-End Logic + Back-End Support with a real right-arrow glyph before 100% Stress-free.
- Increased the hero eyebrow font by 1px to improve the proof line hierarchy above the main hero heading.
- Changed stack-chip text from Node to Node.js and Next to Next.js, then replaced JavaScript with Tailwind CSS and Compose with Jetpack Compose after reviewing which terms fit the stack-chip section best.
- Reordered the dark green proof card assets left to right as Vercel/EAS, Stripe/Postmark, and GGL Play/App Store, with GGL replacing Google and Supabase replaced by EAS.
- Narrowed the horizontal spacing between each proof icon and its related text through three small passes, landing at a denser proof-panel rhythm that still keeps each pair readable.

Work Completed - Dedicated Cinerific Case Study Route

- Added app/projects/cinerific/page.tsx as a dedicated Cinerific case-study page while preserving the same section order, layout structure, header rhythm, CTA placement, and content density used by the Alla Vostra project page.
- Added app/projects/cinerific/ExpandableFlowStacks.tsx by mirroring the Alla Vostra expandable-flow component pattern and adapting the visual surface to Cinerific tablet placeholders.
- Kept the copied page content, headers, boxes, buttons, sections, and section order intentionally aligned with Alla Vostra so the user can later provide the correct Cinerific screenshots and project-specific copy without needing a layout rebuild.
- Replaced the Alla Vostra screenshot-filled Android phone frames with empty landscape Android tablet frames on the Cinerific page, including hero tablet devices and product-flow tablet placeholders.
- Scoped the Cinerific tablet-frame CSS under cinerific-specific selectors so the new blank tablet treatment does not affect the existing Alla Vostra phone screenshots or other landing-page assets.
- Kept the empty tablet frame interiors ready for later screenshot insertion, with visible device shell, transparent/empty screen area, camera/notch details, and responsive landscape sizing.
- Linked the Cinerific case-study card on the landing page to /projects/cinerific, matching the existing clickable behavior already used by Alla Vostra.
- Linked the green Cinerific carousel button to /projects/cinerific so both the card and hero CTA route to the newly created page.
- Preserved existing Alla Vostra routing, page layout, screenshots, and behavior while adding Cinerific in parallel rather than refactoring the shared case-study system.

- Confirmed the static build sees /projects/cinerific as a prerendered route alongside /, /projects/alla-vostra, and /_not-found.

Work Completed - Preview, Cache, and Workflow Handling

- Kept the local Next.js preview available at http://127.0.0.1:3000/ during the visual tuning loop so the user could hard refresh and inspect each small CTA/icon adjustment.
- Cleared stale Turbopack and .next cache artifacts when local browser refreshes did not reflect CSS and component edits, moving stale cache directories out of the project path before restarting preview as needed.
- Used curl and targeted source/CSS checks to distinguish actual code changes from stale local browser or Turbopack output when the tablet Android logo appeared unchanged.
- Preserved the user newest instruction when a later animation-direction request was explicitly disregarded, leaving the View label static and keeping the accepted slide-in direction behavior.
- Maintained the standing workflow of recommending commit messages when asked, using the user preferred past-tense style and short bullet count before the implementation commits were made.
- Regenerated portfolio_PROJECT_SNAPSHOT.txt for this worklog pass so the project snapshot now lists the new Cinerific route and new Android/iOS SVG logo assets.
- Left all application-specific changes inside the Portfolio repository. No external Alla Vostra, Cinerific Android, or Credit King app repository files were edited.

Validation and Checks Performed

- Ran npm run check after the July 20 page and component work; TypeScript completed successfully with tsc --noEmit.
- Ran npm run build:static; Next.js 16.2.10 compiled successfully, completed TypeScript, collected page data, generated 5 static pages, and listed /, /projects/alla-vostra, and /projects/cinerific as static routes.
- Checked http://127.0.0.1:3000/ with curl -I and received HTTP/1.1 200 OK from the local Next.js preview server.
- Checked http://127.0.0.1:3000/projects/cinerific with curl -I and received HTTP/1.1 200 OK from the local Next.js preview server.
- Confirmed git rev-parse HEAD and git rev-parse origin/main both resolve to 0128d3a6607d7044c19c41c923c9f4c2ed16bf85, meaning the latest committed Portfolio implementation state is pushed to origin/main.
- Checked gh run list --limit 5 and confirmed Build static export for Hostinger completed successfully for Added Cinerific case study page at 2026-07-21T00:28:15Z.
- Checked the same GitHub Actions list and confirmed Build static export for Hostinger completed successfully for Refined hero CTAs and project carousel visuals at 2026-07-20T23:59:25Z.
- Verified the new Cinerific route during implementation by checking that /projects/cinerific returned 200, that Cinerific page output contained the expected tablet-frame markers, and that scoped Cinerific CSS existed in app/globals.css.
- Verified the project-button routing change during implementation by confirming the Cinerific card and green carousel state both point at /projects/cinerific.
- Checked the PDF generation convention again with pdftotext before writing this artifact, then generated this root-level PDF with matching metadata.

Files Touched During July 20 Portfolio Work

- app/ProjectCarouselButton.tsx - rebuilt the green project carousel CTA, project-name/category stacks, platform icon/frame rendering, framed Android/iOS image usage, arrow treatment, equal-width responsive behavior, and Cinerific link target.
- app/globals.css - tuned hero CTA sizing, strokes, animation, clipping, device frames, tablet frames, platform icons, social buttons, proof-panel spacing, Cinerific page tablet placeholders, and responsive behavior.
- app/page.tsx - updated hero lede, stack chips, proof-panel labels/order, social buttons, Cinerific case-study href, and landing-page data used by the carousel and project cards.

- app/projects/cinerific/page.tsx - added the new Cinerific case-study route by mirroring the Alla Vostra page layout and swapping screenshot-filled phone devices for empty landscape tablet frames.
- app/projects/cinerific/ExpandableFlowStacks.tsx - added the Cinerific expandable-flow component variant with empty tablet placeholders that can receive screenshots later.
- public/images/android-device-logo.svg - added the canonical reusable Android logo asset copied from the accepted phone-frame artwork so phone and tablet appearances match exactly.
- public/images/ios-device-logo.svg - added the canonical reusable iOS logo asset so iOS appearances can render consistently inside their own phone device frames.
- portfolio_PROJECT_SNAPSHOT.txt - regenerated by ./read_project.sh for this worklog pass, adding the Cinerific route files and new public SVG logo assets to the project snapshot.
- next-env.d.ts - Next.js generated route-type import path changed during static-build validation; no manual product behavior change was intended in this file.
- portfolio_worklog_july20.pdf - generated as this daily worklog artifact in the root-level Portfolio worklog convention.

Follow-Up Context

- The Cinerific case-study page is intentionally a layout-faithful replica of Alla Vostra for now. Its copied textual content and empty tablet frames should be replaced later with correct Cinerific screenshots, accurate Cinerific project details, and final production language when the user provides them.
- The new Cinerific tablet placeholders are scoped so screenshot insertion can happen without disturbing the existing Alla Vostra phone-frame experience.
- The Android and iOS logo image assets are now the safest source of truth for framed mobile-platform icon appearances inside the hero carousel.
- The LinkedIn social button currently has the designed visual treatment but should receive the user actual LinkedIn URL when provided.
- The GitHub and LinkedIn buttons are now forced onto the line below the green CTA. Future CTA work should preserve that line break unless the user asks to redesign the hero control grouping.
- The proof panel now uses Vercel/EAS, Stripe/Postmark, and GGL Play/App Store. Supabase was intentionally removed and EAS was chosen because it is closest to the user deployment/release work adjacent to Vercel in this portfolio context.
- Because npm run build:static can regenerate next-env.d.ts route-type imports, check that file before committing if the next commit is meant to contain only the PDF and refreshed project snapshot.
- Continue honoring the project workflow: after code or artifact generation, ask for or use the user-approved commit message before committing or pushing.

Output Artifact

- Generated portfolio_worklog_july20.pdf at /Users/prahlin/gh/portfolio/portfolio_worklog_july20.pdf.
- The artifact follows the existing Portfolio worklog naming, metadata, section order, technical voice, validation summary, files-touched list, follow-up context, and root-level placement conventions.
- The local project date used for this filename and title is Monday, July 20, 2026 EDT, matching the machine and repository work session clock.
