

Prahlín Portfolio Work Log - July 11, 2026

Compiled summary for Saturday, July 11, 2026 - focus: React Native-first portfolio positioning, green/black Next.js start-page implementation, static Hostinger deployment, GitHub repository setup, real profile-photo replacement, Alla Vostra app-device screenshot treatment, official contact email wiring, and landing-page project miniatures.

Generated in continuity with the established Alla Vostra daily worklog cadence: compact opening summary, source-material section, baseline section, goal list, work-completed sections, validation section, files-touched list, follow-up context, and output-artifact close.

This artifact intentionally covers only the Prahlín/portfolio work represented by commits f27d24d through bb184fe and the surrounding deployment steps performed during this Codex session. Non-portfolio troubleshooting, scratch-disk guidance, and future dynamic-stat planning are excluded from this record.

Source Material Reviewed

- Reviewed all remote-tracked root-level Alla Vostra worklog PDFs in Prahlín/alla_vostra from May through July after fetching origin/main, including alla_vostra_worklog_may11.pdf through alla_vostra_worklog_july11.pdf.
- Extracted text from the full Alla Vostra worklog set with pdftotext and checked page metadata with pdftinfo to preserve the established title cadence, root-level PDF convention, section order, compact bullet-heavy voice, validation language, and output-artifact close.
- Used the mature July 11 Alla Vostra worklog as the closest style reference because it is the latest same-day artifact and already documents a release/deployment-oriented workflow with source material, baseline, goals, work-completed sections, validation, files touched, follow-up context, and output artifact.
- Reviewed the active Portfolio repository at /Users/prahlin/gh/portfolio and confirmed the Git remote points to <https://github.com/Prahlín/portfolio.git>.
- Reviewed the full Portfolio Git history for July 11, covering commits f27d24d, c88da11, 2b15d40, 89457a7, f3a45a4, 5de3525, a40c78e, b1c884a, ef06811, f6080f3, 4b8ca33, e63fa26, and bb184fe.
- Reviewed app/page.tsx, app/globals.css, app/layout.tsx, package.json, package-lock.json, next.config.ts, postcss.config.mjs, tsconfig.json, README.md, DEPLOYMENT.md, .gitignore, .github/workflows/hostinger-static-export.yml, and the tracked image assets in public/images.
- Reviewed the static-export deployment workflow, Hostinger deployment branch behavior, live temporary Hostinger URL checks, and the current clean main branch state before this PDF was generated.

Baseline Status Before Portfolio Work

- The Portfolio project did not yet have a stable public source-control and deployment path at the beginning of this session. Work started from the need to turn prior portfolio planning and a start-page mockup into hostable files, then into a real GitHub-backed deployment.
- The intended positioning was React Native and React mobile-app work first, Kotlin mobile-app work second, and full-stack delivery where it supports mobile product outcomes.

- The visual direction had already been narrowed by the user to a stylish green and black portfolio identity with a generated profile-photo placeholder that could later be replaced by a real photograph.
- The first public site target was Hostinger static hosting, not a running Node.js server. That meant the Next.js project needed a reliable static export path and a deployment shape compatible with Hostinger Git integration.
- The portfolio needed to connect the landing-page story back to real project proof: Alla Vostra, CreditKing, screenshots, worklog history, GitHub history, and visible mobile-app surfaces rather than a generic developer landing page.

Goals for July 11

- Create a usable first Portfolio website rather than only a design recommendation or mockup.
- Make the first viewport clearly signal Prahlin, React Native, full-stack mobile development, Android release readiness, and the green/black brand language.
- Use Next.js, React, Tailwind CSS tooling, Node package scripts, lucide icons, static export settings, and a conventional project layout that can live in GitHub.
- Package the project for Hostinger, first through static files and then through a GitHub-connected automatic deployment branch.
- Replace temporary/generated profile imagery with real Martin Prahlin profile photos while preserving the Prahlin brand label in the top-left navigation.
- Replace generic mock-device filler with real Alla Vostra app screenshots so the landing page has immediate proof of mobile-app work.
- Keep Node build output, dependency folders, archives, environment files, and generated bundles out of the GitHub repository through a project-specific .gitignore.
- Ask for commit messages before committing new Portfolio changes once that preference was established, and keep commit scope limited to requested files.

Work Completed - Initial Portfolio Site and Visual System

- Built the initial Portfolio source as a Next.js app with app/page.tsx, app/layout.tsx, app/globals.css, next.config.ts, postcss.config.mjs, package.json, package-lock.json, tsconfig.json, README.md, DEPLOYMENT.md, public/favicon.svg, and initial generated image assets.
- Created a green/black landing page centered on a React Native Full-Stack Mobile Developer headline, with supporting copy for polished mobile apps, secure checkout flows, and production-ready Android pipelines.
- Added top navigation for Case Studies, Stack, Worklog, and Contact, plus a Prahlin monogram/brand mark that remains distinct from the later Martin Prahlin profile label.
- Built a hero section with a profile orbit, two mobile-device mockups, proof panel, stack chips, GitHub link, and an Alla Vostra call-to-action that scrolls to the case-study section.
- Added proof stats for Alla Vostra commits, PDF worklogs, CreditKing commits, and Android release prep to make the landing page read as a documented build history rather than only a visual resume.
- Added case-study cards for Alla Vostra and CreditKing, a stack section covering React/React Native/Expo/Next.js/Tailwind/Node and Kotlin, a worklog section, and a contact panel.

- Used lucide-react icons for actions and proof points, and kept the UI dark, compact, and project-centered rather than building a generic marketing hero.

Work Completed - Repository, Packaging, and Hostinger Deployment Path

- Moved the Portfolio files through the requested local folder organization and into the active Git checkout at /Users/prahlin/gh/portfolio.
- Created and used the Prahlin/portfolio GitHub repository as the source of truth for the portfolio website.
- Added static-export support through npm run build:static and NEXT_OUTPUT=export so Hostinger can serve the generated files without a persistent Node.js runtime.
- Added .github/workflows/hostinger-static-export.yml so pushes to main build the static export and force-push the out/ directory to a dedicated hostinger-deploy branch.
- Connected Hostinger to the Portfolio GitHub repository, using branch hostinger-deploy and root directory public_html for the hosted static output.
- Guided the early manual Hostinger upload and extraction path, then shifted to the cleaner Git-backed workflow once Hostinger was connected to GitHub.
- Added and expanded .gitignore so node_modules, .next, out, ZIP archives, logs, local env files, package-manager caches, .DS_Store, editor folders, dist, and build outputs stay out of the repository.
- Added sharp as a dev dependency for possible local image-processing workflows, while later profile-photo updates ultimately used prepared image assets rather than committing generated Node artifacts.

Work Completed - Profile Photo Replacement and Identity Refinement

- Replaced the original generated profile placeholder with real Martin profile photos across several user-directed passes: martin1.jpg, martin2.jpg, and finally martin3.jpg.
- Normalized image filenames to lowercase where needed so paths resolve reliably on case-sensitive Linux hosting environments.
- Updated the visible profile label and alt text to Martin Prahlin while preserving Prahlin in the top-left brand mark as requested.
- Kept the profile-photo iteration scoped to the public/images assets and app/page.tsx references, avoiding broad redesign of the hero while the source image was refined externally.
- Moved from the first real photo to a better-fitting green/black background-gradient version that matched the site visual system more closely.
- Preserved older profile-image assets in the repository where they were already tracked, while making the live page reference martin3.jpg as the active profile image.

Work Completed - Alla Vostra Device Inlay and Screenshot Treatment

- Refactored the PhonePreview component so a device mockup can render a real Next.js Image inlay instead of only the generic CSS chart/card placeholder.
- Replaced the generic Alla Vostra device filler with a real Alla Vostra startup screenshot, giving the hero area an immediate connection to the mobile app project.
- Iterated on the phone-inlay fit after the first screenshot was clipped by the mock device aspect ratio.
- Added and then revised safe-area handling around the screenshot: first a broader

containment approach, then a larger aspect-ratio-correct image, and finally a slim top-only 2 percent band so the Android toolbar is not obscured by the device frame.

- Substituted `startup_screen_large.png` for the smaller startup image in the hero device because the large asset better matched the phone-frame ratio.
- Kept left, right, and bottom edges visually edge-to-edge after the final top-only adjustment, accepting that any remaining crop pressure should fall lower in the screenshot rather than over the Android toolbar.

Work Completed - Contact Email and Alla Vostra Landing-Page Miniatures

- Replaced the temporary contact mailto link and visible text with the official developer email `martin@prahlproductions.com`.
- Imported three Alla Vostra project screenshots into `public/images`: `startup_screen_small.png`, `products_overlay_small.png`, and `confirmed_overlay_small.png`.
- Added a compact three-image miniature strip under the Alla Vostra case-study card so visitors see real mobile app screens before navigating to any later dedicated case-study page.
- Kept the miniatures in phone-ratio 9:16 frames with restrained borders and shadow styling so they support the case-study card without overwhelming the landing page.
- Left the CreditKing card text-only for now, preserving the current landing-page balance until dedicated CreditKing screenshots or a project page are added.
- Preserved the hero large Alla Vostra inlay and added the smaller screenshots only to the lower case-study section, keeping separate roles for hero proof and case-study preview.

Validation and Checks Performed

- Ran `npm run check` repeatedly after source edits; TypeScript completed successfully before the relevant commits were pushed.
- Ran `npm run build:static` repeatedly after source and image edits; Next.js static export completed successfully before deployment commits were pushed.
- Confirmed GitHub Actions runs for the Hostinger static-export workflow completed successfully after the pushed Portfolio commits.
- Checked live Hostinger HTML with cache-busted query parameters after deployments to confirm references to `martin2.jpg`, `martin3.jpg`, `startup_screen.png`, `startup_screen_large.png`, `startup_screen_small.png`, `products_overlay_small.png`, `confirmed_overlay_small.png`, and `martin@prahlproductions.com` as the project evolved.
- Confirmed the final Portfolio working tree was clean before generating this worklog PDF.
- Confirmed the current main branch matches origin/main before this artifact was created.
- Did not implement the proposed automatic GitHub commit-count refresh workflow during this session; that idea was intentionally deferred at the user request.
- Did not create dedicated `/projects/alla-vostra` or `/projects/creditking` pages during this session; the landing page now only previews the Alla Vostra project with miniatures.

Files Touched During July 11 Portfolio Work

- `.github/workflows/hostinger-static-export.yml`

- .gitignore
- DEPLOYMENT.md
- README.md
- app/globals.css
- app/layout.tsx
- app/page.tsx
- next.config.ts
- package-lock.json
- package.json
- postcss.config.mjs
- public/favicon.svg
- public/images/confirmed_overlay_small.png
- public/images/martin-profile.png
- public/images/martin1.jpg
- public/images/martin2.jpg
- public/images/martin3.jpg
- public/images/products_overlay_small.png
- public/images/start-page-mockup-reference.png
- public/images/startup_screen_large.png
- public/images/startup_screen_small.png
- tsconfig.json

Follow-Up Context

- Create a dedicated Alla Vostra case-study page, likely /projects/alla-vostra, so the hero button can eventually move from section scrolling to a full project narrative.
- Add a dedicated CreditKing case-study page and screenshot set once the landing page needs parity between the two featured projects.
- Update README.md and DEPLOYMENT.md so their placeholder profile-photo and placeholder email references match the current martin3.jpg and martin@prahlproductions.com implementation.
- Consider replacing hardcoded proof stats with a build-time GitHub commit-count generator later, using repository_dispatch or a scheduled workflow only when that automation becomes worth the complexity.
- Audit the landing page at desktop and mobile widths after any future screenshot additions so the case cards do not become visually crowded.
- Keep asking for Portfolio commit messages before committing/pushing new changes unless the user explicitly instructs otherwise.

Output Artifact

- Filename: portfolio_worklog_july11.pdf
- Created at the repository root in /Users/prahlin/gh/portfolio.
- Follows the established root-level Alla Vostra daily worklog naming convention, adapted from alla_vostra_worklog_july11.pdf to portfolio_worklog_july11.pdf.
- This is the first Portfolio project worklog artifact for Prahlin/portfolio.
