

Prahl Portfolio Work Log - July 15, 2026 (Part 1)

Compiled summary for Wednesday, July 15, 2026 - Part 1 - focus: refining the Portfolio landing page after the July 14 Cinerific and carousel pass, hardening the top navigation for compressed portrait mobile widths, tightening hero proof-stat language, adding quoted app-project names to the rotating green CTA, pushing the update through the Hostinger static-export pipeline, and creating a Portfolio project snapshot script equivalent to the Alla Vostra and Cinerific `read_project.sh` convention.

Generated in continuity with the established Alla Vostra, Cinerific, and Prahl Portfolio daily worklog cadence: compact opening summary, source-material section, baseline section, goal list, work-completed sections, validation section, files-touched list, follow-up context, and output-artifact close.

This artifact intentionally covers only Prahl/portfolio work performed for July 15 Part 1: commit 3fa5aa5, the Hostinger/GitHub deployment check for that commit, the new `read_project.sh` snapshot utility, the generated `portfolio_PROJECT_SNAPSHOT.txt` artifact, and this worklog-generation step. Alla Vostra and Cinerific material was used as naming, style, structure, length, and content-type reference only.

Source Materials Reviewed

- Extracted text from all 47 available local worklog PDFs across `/Users/prahlin/gh/alla_vostra`, `/Users/prahlin/gh/cinerific`, and `/Users/prahlin/gh/portfolio` using `pdftotext`. The reviewed corpus included 43 Alla Vostra worklogs, 2 Cinerific worklogs, and 2 prior Portfolio worklogs.
- Reviewed the Alla Vostra worklog series from May through July, including part-numbered files such as `alla_vostra_worklog_july7_part1.pdf` and mature release/deployment logs such as `alla_vostra_worklog_july11.pdf`, to preserve the established daily-report cadence.
- Reviewed `cinerific_worklog_july 12.pdf` and `cinerific_worklog_july 14.pdf` as project-specific examples of adapting the Alla Vostra convention to a Kotlin/Compose Android project while preserving source-material, baseline, validation, and follow-up sections.
- Reviewed `portfolio_worklog_july11.pdf` and `portfolio_worklog_july14.pdf` as the closest same-project references for title format, root-level naming, five-page body length, Hostinger/static-export validation language, and Portfolio-specific follow-up conventions.
- Reviewed `/Users/prahlin/gh/alla_vostra/read_project.sh` and `/Users/prahlin/gh/cinerific/read_project.sh` to model the new Portfolio snapshot script: instruction header, pruned tree, line-numbered file dumps, ignored generated files, and binary-asset inventory instead of raw bytes.
- Reviewed current Portfolio Git context on main tracking origin/main, recent commits through 3fa5aa5, GitHub Actions run history for the Hostinger static-export workflow, and the active files `app/page.tsx`, `app/globals.css`, `app/ProjectCarouselButton.tsx`, `package/deployment config`, and public assets.
- Checked PDF metadata and page counts with `pdftotext`, and used `pdftotext` output to compare section order, bullet density, filename conventions, and the compact technical voice used across previous artifacts.

Baseline Status Before July 15 Part 1 Work

- The July 14 Portfolio site already presented a green/black React Native-first portfolio with Martin Prahl visible in the top-left brand, a real profile photo, Alla Vostra and Credit King phone mockups, a Cinerific tablet mockup, three case-study cards, and a rotating hero CTA.

- The hero proof strip had already shifted from narrow project counters to broader developer proof, but the language still needed the user-requested final wording: 3yrs, 1k+ Quality GitHub Commits, 50+ Project worklogs, and 5 Official Play/App Store Releases.
- The top card navigation still had a compressed portrait risk: Case Studies, Stack, Worklog, and Contact could wrap, clip, or visually leave the top card when tested through tight smartphone-width screenshots.
- The green hero CTA rotated project names, but the labels read as plain View Alla Vostra, View Credit King, and View Cinerific. The user wanted single apostrophes around each app project name to make the label semantics clearer.
- The Portfolio repo did not yet have a read_project.sh snapshot utility equivalent to the existing Alla Vostra and Cinerific scripts, even though those projects already had a pre-session snapshot convention.
- The Portfolio project preference remained in force: before committing or pushing Portfolio work, ask the user for the commit message rather than auto-writing one.

Goals for July 15 Part 1

- Keep the top navigation links on one row in compressed portrait mobile aspect ratios without letting Case Studies, Stack, Worklog, or Contact jump to a second line.
- Prefer reducing horizontal spacing, padding, and font sizing at narrow widths over allowing nav text to wrap.
- Update the proof-stat copy to the user-approved wording: 3yrs, 1k+ Quality GitHub Commits, 50+ Project worklogs, and 5 Official Play/App Store Releases.
- Add single apostrophes around every app project name in the green carousel button: View 'Alla Vostra', View 'Credit King', and View 'Cinerific'.
- Build, commit, and push the approved website update to the official GitHub-backed Hostinger path after receiving the user-supplied commit message.
- Create a Portfolio read_project.sh script that can regenerate a project snapshot before each future Portfolio work session.
- Generate the first July 15 Portfolio worklog as Part 1, following the pre-existing naming, style, structure, length, and content type conventions.

Work Completed - Mobile Top Navigation Hardening

- Updated app/globals.css so the top navigation anchors explicitly use white-space: nowrap, preventing individual labels from splitting into multiple lines.
- Changed the mobile navigation behavior from flex wrapping to a compressed grid at narrower breakpoints, with minmax(0, ...) tracks so each link can shrink inside its assigned slot rather than forcing the whole row wider than the top card.
- Added min-width: 0 and flex: 1 1 0 behavior to the mobile nav links so text and columns obey the available width instead of preserving browser default intrinsic minimums.
- Reduced horizontal padding and font size across the 720px, 380px, and 340px breakpoints so the links fit tightly on one line during portrait smartphone compression.
- Capped the mobile top card and nav width against the visible viewport, preventing hero or browser screenshot-width quirks from letting the nav row visually bleed outside the card.
- Cleared and restarted the Next/Turbopack dev cache when local CSS chunks stayed stale after rapid edits, then confirmed the compiled CSS reflected the new minmax and shrink rules.
- Verified with a true 320px Playwright screenshot using the installed Chrome channel that all four navigation links were visible on one row inside the top card.

Work Completed - Proof Stats and Carousel Labels

- Updated app/page.tsx so the first proof-stat value reads 3yrs and its label reads UI/UX + Front-end + Back-end.
- Changed the GitHub proof column from 500+ GitHub commits to 1k+ Quality GitHub Commits, matching the broader output framing requested by the user.
- Changed the mobile-release proof column from EAS Android release prep to 5 Official Play/App Store Releases, making the stat read as a concrete release count instead of a tooling/status note.
- Kept the Project worklogs column at 50+ Project worklogs, preserving the documentation-proof thread established in the previous Portfolio worklogs.
- Updated app/ProjectCarouselButton.tsx so the green carousel labels now include single apostrophes around the app project names: View 'Alla Vostra', View 'Credit King', and View 'Cinerific'.
- Preserved the five-second carousel timing, section href updates, bumpy swoosh animation, reduced-motion fallback, and existing button styling while changing only the project-name presentation.

Work Completed - Commit, Push, and Official Website Pipeline

- Asked the user for the Portfolio commit message before committing, preserving the standing project preference established earlier in the Portfolio session.
- Committed the nav, proof-stat, and carousel-label changes as commit 3fa5aa5 with the exact user-provided commit message.
- Pushed/verified main against origin/main. The push reported Everything up-to-date because origin/main already pointed at the new commit after the local commit operation completed.
- Confirmed main and origin/main both resolved to 3fa5aa5b8d2cc9a32b9c55a03fd1842cd2431522 after the push/verification step.
- Checked GitHub Actions with gh run list and confirmed the Build static export for Hostinger workflow completed successfully for the 3fa5aa5 push.
- Stopped the local Next dev server after the deployment check so no preview process was left running unnecessarily.

Work Completed - Portfolio Project Snapshot Script

- Studied both reference scripts: Alla Vostra creates separate web and mobile snapshots, while Cinerific creates one Android snapshot with source sections and binary inventories.
- Added read_project.sh at the Portfolio repo root, using the same general convention: root-relative PROJECT_DIR, root-level output file, instruction header, ignored generated paths, project tree, file-content sections, and binary inventory sections.
- Configured the Portfolio snapshot output as portfolio_PROJECT_SNAPSHOT.txt so future sessions can begin by regenerating and reading the current source context.
- Included Portfolio-specific notes in the snapshot header: main branch source, GitHub Actions building main into hostinger-deploy, Hostinger public_html root, public assets under public/, and the standing commit-message requirement.
- Dumped line-numbered app source files: app/layout.tsx, app/page.tsx, app/ProjectCarouselButton.tsx, and app/globals.css.
- Dumped line-numbered root, tooling, deployment, and config files including .gitignore, README.md, DEPLOYMENT.md, package.json, package-lock.json, Next/Tailwind/TypeScript config, Hostinger workflow YAML, favicon, and read_project.sh itself.
- Added git context to the snapshot: current branch, short status, recent commits, and remotes, so a future Codex session can quickly understand repo state before editing.

- Added inventories for public image assets, Portfolio PDF worklogs, and deployment ZIP archives by path, byte size, and modified time, while intentionally avoiding raw PNG/JPG/PDF/ZIP bytes.
- Ran `./read_project.sh` successfully and generated `portfolio_PROJECT_SNAPSHOT.txt` at the repository root as the first Portfolio snapshot artifact.

Validation and Checks Performed

- Ran `npm run check` after the July 15 source changes; TypeScript completed successfully.
- Ran `npm run build:static` after the July 15 source changes; Next.js produced the static Hostinger-compatible build successfully.
- Used Playwright with the installed Chrome channel at a true 320px viewport to confirm the top navigation rendered Case Studies, Stack, Worklog, and Contact on one row without line wrapping.
- Used `curl` and generated CSS inspection to confirm the compiled CSS included the mobile nav grid, minmax tracks, width caps, and link shrink rules after clearing stale `.next/dev` cache output.
- Confirmed the Hostinger static-export GitHub Action completed successfully for commit `3fa5aa5`.
- Ran `bash -n read_project.sh`; shell syntax passed.
- Ran `./read_project.sh`; it generated `portfolio_PROJECT_SNAPSHOT.txt` successfully and reported its output path.
- Checked the generated snapshot size and structure with `wc`, section searches, and inventory inspection before this worklog was generated.
- Extracted text from all 47 pre-existing worklog PDFs with `pdftotext` and reviewed the prior Portfolio/Cinerific examples before writing this PDF.

Files Touched During July 15 Part 1 Portfolio Work

- `app/globals.css` - hardened top-card navigation against compressed portrait widths with nowrap labels, grid/minmax layout, reduced mobile padding/font sizes, viewport width caps, and small-width breakpoints.
- `app/page.tsx` - updated proof-stat values and labels to 3yrs, 1k+ Quality GitHub Commits, 50+ Project worklogs, and 5 Official Play/App Store Releases.
- `app/ProjectCarouselButton.tsx` - added single apostrophes around the rotating app project names in the green hero CTA.
- `read_project.sh` - new executable Portfolio snapshot generator based on the Alla Vostra and Cinerific `read_project.sh` conventions.
- `portfolio_PROJECT_SNAPSHOT.txt` - generated project snapshot artifact produced by `read_project.sh` for future pre-session context loading.
- `portfolio_worklog_july15_part1.pdf` - this new July 15 Part 1 Portfolio worklog artifact generated at the repository root.

Follow-Up Context

- Commit `read_project.sh`, `portfolio_PROJECT_SNAPSHOT.txt`, and this July 15 Part 1 PDF only after the user provides a commit message.
- If the snapshot file is intended to be regenerated and tracked like the Alla Vostra/Cinerific snapshot files, keep it at the repo root and update it before each session. If it should remain local-only later, add an explicit ignore rule.
- Recheck the 320px and 360px top navigation after any future label, brand, or localization changes, because the current solution is intentionally tuned for the existing four labels.

- If the proof stats become dynamic later, treat GitHub commit counts and release counts as build-time or script-generated data rather than client-side runtime calls.
- Dedicated project pages remain a natural next step: the carousel button currently navigates to landing-page case-study anchors rather than full project-detail pages.
- Continue keeping generated build output, Node dependencies, environment files, and deployment archives out of source commits unless the user explicitly asks otherwise.

Output Artifact

- Generated file: portfolio_worklog_july15_part1.pdf
- Location: /Users/prahlin/gh/portfolio/portfolio_worklog_july15_part1.pdf
- Naming follows the existing root-level Portfolio convention and the Alla Vostra part-number convention: portfolio_worklog_july15_part1.pdf.
- This PDF is the first Portfolio worklog for July 15 and intentionally uses Part 1 because additional Portfolio work may occur later the same day.
