

Prahl Portfolio Work Log - July 23, 2026

Compiled summary for Thursday, July 23, 2026 - focus: responsive case-study card refinement, Prahl.dev title and device-stack presentation, corrected project commit/worklog counts, hero proof-stat copy and wrapping, top navigation copy, Stack section column behavior, case-study breakpoint tuning, Prahl.dev screenshot reuse inside the hero Credit King device frame, public deployment confirmation, and local commit-message automation.

Generated in continuity with the established Prahl Portfolio daily worklog cadence: compact opening summary, source-material section, baseline section, goal list, work-completed sections, validation section, files-touched list, follow-up context, and output-artifact close.

This artifact intentionally covers only Prahl/portfolio work performed during the July 23 local project session: the refreshed project snapshot, review of every pre-existing Portfolio worklog PDF, the landing-page and project-page work represented by commits f5892f4, 122c865, and 79c31b8, successful pushes to origin/main, successful Hostinger static-export workflow runs, local validation checks, and the local uncommitted commit-message automation created after the final public push. Alla Vostra, Cinerific, and Credit King application repositories were read only where their remote commit/worklog counts informed visible Portfolio copy; they were not modified for this record.

Source Materials Reviewed

- Ran `./read_project.sh` from `/Users/prahlin/gh/portfolio` and regenerated `portfolio_PROJECT_SNAPSHOT.txt` before writing this worklog, preserving the project convention that Codex refreshes the current source snapshot before continuing Portfolio work.
- Reviewed the refreshed `portfolio_PROJECT_SNAPSHOT.txt`, including the current source tree, app source dumps, root/tooling/deployment configuration, public image inventory, PDF inventory, git context, and the standing instruction to ask for a commit message before committing or pushing.
- Reviewed every pre-existing Portfolio root-level worklog PDF: `portfolio_worklog_july11.pdf`, `portfolio_worklog_july14.pdf`, `portfolio_worklog_july15_part1.pdf`, `portfolio_worklog_july15_part2.pdf`, `portfolio_worklog_july16.pdf`, `portfolio_worklog_july19.pdf`, `portfolio_worklog_july20.pdf`, `portfolio_worklog_july21.pdf`, and `portfolio_worklog_july22.pdf`.
- Extracted text from all nine existing Portfolio PDFs with `pdftotext` to preserve the same title cadence, opening summary density, section order, compact bullet-heavy technical voice, validation language, files-touched list, follow-up context, and output-artifact close.
- Used `portfolio_worklog_july22.pdf` as the closest same-project reference because it already documents late-stage landing-page polish, case-study screenshot work, public synchronization, responsive scroll behavior, and the current root-level PDF naming convention.
- Reviewed July 23 Git history through `git log`, `git show --stat`, `git show --name-status`, targeted source inspection, and the final `HEAD/origin/main` match at `79c31b80d09eedfc6f3cafbba2a88ceb3bc38a2f`.
- Reviewed the committed source scopes for `f5892f4`, `122c865`, and `79c31b8`, covering case-study card layout, Prahl.dev branding, hero proof stats, Stack section behavior, responsive breakpoints, project title/device stacks, and hero screenshot placement.
- Reviewed `app/page.tsx`, `app/globals.css`, `app/CaseDescription.tsx`, `app/ProjectCarouselButton.tsx`, `app/ProofStats.tsx`, `app/layout.tsx`, `app/projects/alla-vostra/page.tsx`, `app/projects/cinerific/page.tsx`, `package.json`, `.github/hooks/prepare-commit-msg`, and `scripts/generate-commit-message.mjs`.
- Reviewed the remote repositories represented by landing-page case-study cards to keep visible counts project-correct: Cinerific at 35 commits and 9 worklogs, Alla Vostra at 333 commits and 44 worklogs, Credit King at 82 commits and 0 worklogs, and the Portfolio website at 42 commits and 9 pre-existing Portfolio worklogs before this new PDF was created.
- Checked GitHub Actions run history with `gh run list` and confirmed the Build static export for Hostinger workflow completed successfully for all three July 23 public pushes.

Baseline Status Before July 23 Work

- The July 22 Portfolio site already had the Prahl brand, green/black landing page, responsive hero CTA system, case-study row-targeted arrow behavior, Alla Vostra and Cinerific project routes, and the newly added Portfolio case-study card.
- The case-study cards still needed stronger right-side margin protection so text, chips, stats, project-name treatments, and screenshots would expand vertically instead of clipping horizontally when a card narrowed.
- The card descriptions, eyebrow text, and chip stacks were still being visually evaluated during

active horizontal browser resizing, especially where equal row counts and justified text were required across all cards.

- The old white case-study titles did not yet match the accepted green-button project-name typography, color, stroke, and proportional device/icon stack treatment.
- The PrahL.dev / Portfolio card still needed final naming treatment, including the PrahL.dev title stack, the separate THIS WEBSITE label, and the matching web icon placement used by the other case-study title/device rows.
- The visible project commit counts and worklog counts still needed to be corrected from remote repository truth rather than older hardcoded values, while the global 1.0k+ Quality GitHub Commits proof stat was intentionally left untouched.
- The Stack section had a mobile portrait risk where cards could collapse to a single column even though the user wanted at least two columns per row and vertical expansion for crowded contents.
- The landing hero proof stats, top navigation text, and main headline wrapping still needed copy and layout updates after the July 22 visual pass.
- The one-column case-study layout snapped later than the user wanted during portrait window stretching, requiring a more appropriate one-to-two column breakpoint without changing the established two-to-three column timing.
- The project workflow remained local-first unless the user explicitly requested a public push, with commit-message recommendations supplied in the requested header-plus-dash-point style.

Goals for July 23

- Make all four case-study cards resilient during horizontal resizing by protecting right-side padding, preserving left/right card margins, and allowing crowded content to grow the card vertically.
- Standardize every card to six relevant chips arranged as two rows of three, with each chip expanding horizontally within the card padding zones just like the chip stack below the landing hero.
- Reduce each case-study description to exactly 25 words and keep the visible row quantity synchronized across cards without removing normal spaces between words.
- Apply controlled text justification to project descriptions while avoiding the earlier issue where spaces between words disappeared during row-equalization work.
- Bring case-study project names and project device/icon stacks into visual parity with the accepted green carousel button artwork, but only inside the case-study cards.
- Center each device/icon stack between its project-name right edge and the paragraph text right edge while preserving project-name left-edge alignment across cards.
- Correct the PrahL.dev card label and THIS WEBSITE treatment while keeping the card description alignment logic consistent with the other project descriptions.
- Update the landing hero proof stats and top navigation labels to the user-approved values, including About, 3yrs, 1.0k+, 0.1k+, 8 shipped products, Full Stack, and Real-Time Project Worklogs.
- Keep Stack section cards at a minimum of two columns per row, even in narrow portrait mode, and let card contents force vertical growth rather than horizontal overflow.
- Add local commit-message automation so clicking the commit button can prefill a one-line header followed by five hyphen bullets describing the most relevant changes since the last commit.

Work Completed - Case Study Card Layout and Text Systems

- Protected right-side case-card margins to match the safer Stack card behavior on the front page, preventing text and image content from bleeding into the card edge during narrow layouts.
- Adjusted card image rules so screenshots scale down within the available card width instead of forcing horizontal overflow, with multiple adjacent screenshots keeping proportional shared height when they appear beside each other.
- Standardized all four landing-page case studies to exactly six chips each: Cinerific, Alla Vostra, Credit King, and the PrahL.dev Portfolio card now each render two rows of three chips.
- Selected the most relevant six chips per project and removed less relevant labels so each card reads as a concise project stack rather than a broad technology dump.
- Reduced every case-study project description to exactly 25 words and represented the visible text as four controlled lines per card in app/page.tsx.
- Added app/CaseDescription.tsx as a client-side description renderer that measures each visual line, scales it down only when it would overflow, and distributes word spacing when the line has room to stretch.
- Preserved normal space characters between words while implementing the line-stretch behavior, after the user specifically corrected the earlier no-space visual result.

- Kept portrait-mode description justification active so one-card-per-row layouts still preserve the same line-fill logic instead of reverting to ragged paragraph widths.
- Revised case-card eyebrow behavior after experimentation: the green top-left text now occupies the left third of the top row, remains left-aligned, wraps naturally, and no longer uses the same forced justification behavior as descriptions.
- Reserved the right third of the case-card top row for the commit chip and worklog text, keeping that stack horizontal and right-aligned without encroaching on card padding.
- Matched commit-chip/worklog right-side padding to the left-side case-card padding so the card top row no longer clips through the card border at narrow widths.

Work Completed - Project Titles, Device Stacks, and Prah!.dev Card

- Copied the accepted project-name stack style from the green carousel button into the case-study card titles for Cinerific, Alla Vostra, and Credit King, including font size, fill color, stroke behavior, and spacing rhythm.
- Removed the Cinerific industry word from the case-study title stack after testing white strokes at several thicknesses and determining the simpler project-name-only treatment was preferred.
- Scaled the case-study project-name and device/icon stack treatment up from the first imported size, then reduced the device/icon stacks by ten percent to avoid title-to-stack clipping in narrow cards.
- Imported ProjectDeviceStack usage into case-study card titles so mobile device frames, tablet frames, and web icons match the accepted green-button platform artwork rather than using separate approximations.
- Placed device/icon stacks to the right of each project name and aligned them by grid logic so project names keep the same left edge while the stack occupies the remaining title row lane.
- Added responsive internal gap logic to the device/icon stacks: assets retain breathing room in wide cards but close down only when the available title lane becomes severely compressed.
- Matched the Alla Vostra web icon height to the adjacent device frames by applying the case-card-only webIconScale value, leaving the original green button platform sizing untouched.
- Converted the Portfolio card title from This Portfolio Website into the user-approved Prah!.dev presentation with a centered THIS WEBSITE label beneath the name stack.
- Styled the THIS WEBSITE label with the same general face, weight, color family, opacity, and responsive size relationship as the case-card worklog text while keeping it outside the main project-name stroke treatment.
- Inserted the matching web icon after the Prah!.dev title stack and used the same responsive alignment and spacing logic as the other case-study title/device rows.
- Preserved the existing Prah!.dev card screenshots in the case-study card while also reusing the portrait editor screenshot elsewhere in the hero device treatment later in the session.

Work Completed - Counts, Hero Copy, Navigation, and Stack Section

- Updated landing-page case-study card stats to the remote-backed visible counts requested by the user: 35 commits / 9 worklogs for Cinerific, 333 commits / 44 worklogs for Alla Vostra, 82 commits / 0 worklogs for Credit King, and 42 commits / 9 worklogs for Prah!.dev before this PDF was generated.
- Added plain worklog-quantity text beneath each commits chip, centered under the chip without its own chip box, and matched the vertical gap to the relationship between chip text and the chip bottom edge.
- Reduced case-card worklog text weight to 400 and then lowered its opacity to 50 percent so the worklog count supports the commit chip without competing with it.
- Updated the Portfolio card name semantics from Prahlin to Prah!.dev and converted the parenthetical from bold This Website to a lighter, centered THIS WEBSITE label in the case-study title zone.
- Added About between Worklog and Contact in the top navigation as non-actionable nav text, preserving the existing top card link rhythm while adding the requested visible word.
- Revised the hero headline order so Full Stack appears before RN / Kotlin, then forced stable line breaks after Full Stack and RN / Kotlin regardless of window stretching or headline font resizing.
- Updated hero proof stats to 3yrs Full Stack Expertise, 1.0k+ Quality GitHub Commits, 0.1k+ Real-Time Project Worklogs, and 8 Shipped Mob/Web Products.
- Added app/ProofStats.tsx as a client-side proof-stat label controller that measures label widths and synchronizes all four proof-stat labels into one-line, two-line, or three-line modes together.
- Kept the global 1.0k+ Quality GitHub Commits stat untouched when updating local case-study commit counts, matching the user instruction not to change the broad proof metric.
- Changed the Stack section capability grid so it never collapses below two columns per row, including

narrow portrait mode, and lets overcrowded card contents expand vertically like the case-study cards.

- Synchronized line-wrapping timing for the four proof categories inside the stats card so the earliest wrap state applies to the full group rather than one stat wrapping alone.

Work Completed - Breakpoints, Hero Screenshot, and Public Deployment

- Adjusted the case-study grid so the one-column layout changes to two columns earlier during portrait window stretching, based on the user-provided screenshot of the Alla Vostra card and then revised to the midpoint after the first attempt snapped too early.
- Preserved the existing two-to-three column snapping behavior while changing only the one-to-two column breakpoint, leaving the desktop three-card rhythm intact.
- Inserted the PrahL.dev portrait case-study screenshot into the Credit King device frame in the landing hero, centered horizontally and vertically with preserved aspect ratio and empty space allowed where necessary.
- Kept the same screenshot inside the PrahL.dev case-study card after the user clarified it should not be removed from the card while being reused in the hero device frame.
- Scoped the finance phone screenshot treatment so the inserted portrait image uses the Credit King hero frame without disturbing other landing-page phone or tablet devices.
- Cleared stale development cache output several times during the responsive tuning passes when browser refreshes failed to show current CSS changes immediately.
- Recommended user-facing commit messages at the requested points, using the established style of a short header followed by concise past-tense hyphen bullets.
- Committed and pushed the first July 23 batch as f5892f4, Refined case study cards and PrahL.dev branding, after the case-card margin, chip, description, title, and device-stack work stabilized.
- Committed and pushed the second July 23 batch as 122c865, Portfolio landing layout refinements, after the hero wrapping, visible counts, PrahL.dev title label, and Stack section two-column behavior were set.
- Committed and pushed the third July 23 batch as 79c31b8, Portfolio case-study and hero refinements, after the About nav text, proof-stat label wrapping, case-study breakpoint tuning, and hero Credit King screenshot insertion were complete.

Work Completed - Local Commit Message Automation

- Added .github/hooks/prepare-commit-msg as a local Git hook entry point that calls the project Node generator when Git opens a commit message file.
- Added scripts/generate-commit-message.mjs as a standard Node script that reads the staged diff first and falls back to the working-tree diff when no staged files exist.
- Implemented skip behavior for commit, merge, message, and squash sources so manual messages, merges, squash flows, and amended messages are not overwritten.
- Preserved any existing non-comment commit-message content by exiting early when the message file already contains user text.
- Generated a concise one-line header from the touched areas, with special handling for hero, case-study, layout, project page, asset, and tooling changes.
- Generated exactly five hyphen bullets from changed files, added files, diff hints, and fallback statements, matching the user request for a header followed by five dashed/hyphen sentences.
- Added npm run setup:commit-hook to package.json so the repo can set core.hooksPath to .github/hooks without requiring the user to remember the raw git config command.
- Ran npm run setup:commit-hook locally; git config --get core.hooksPath now returns .github/hooks. This tooling is local and currently uncommitted, not part of the public website source yet.

Validation and Checks Performed

- Ran npm run check after the local commit-message automation was added; TypeScript completed successfully with tsc --noEmit.
- Ran git diff --check after the local tooling work. The command reported trailing whitespace in the regenerated portfolio_PROJECT_SNAPSHOT.txt line-numbered snapshot output, not in the July 23 application source edits or the commit-message tooling files.
- Confirmed git rev-parse HEAD and git rev-parse origin/main both return 79c31b80d09eedfc6f3cafbbba2a88ceb3bc38a2f, meaning the latest committed website source is synchronized with origin/main.
- Confirmed the current branch is main and the working tree has only local artifact/tooling changes after the public pushes: package.json, portfolio_PROJECT_SNAPSHOT.txt, .github/hooks/, scripts/, and this

new PDF after generation.

- Checked gh run list and confirmed Build static export for Hostinger completed successfully for Refined case study cards and PrahL.dev branding, Portfolio landing layout refinements, and Portfolio case-study and hero refinements.
- Reviewed git show --stat for f5892f4: 9 files changed with 599 insertions and 67 deletions, covering the largest case-study card and PrahL.dev branding pass.
- Reviewed git show --stat for 122c865: 4 files changed with 85 insertions and 16 deletions, covering hero headline wrapping, stat/worklog count updates, PrahL.dev label styling, and Stack section column behavior.
- Reviewed git show --stat for 79c31b8: 8 files changed with 377 insertions and 195 deletions, covering ProofStats, case-study title/stat layout, About nav, breakpoint tuning, and the hero Credit King screenshot insertion.
- Verified the local commit-message generator produced the requested sample shape: a single header followed by five hyphen bullets, while leaving manual/merge/squash/amend messages untouched.
- Regenerated portfolio_PROJECT_SNAPSHOT.txt before this PDF so the current source tree, recent commits, image inventory, PDF inventory, and local uncommitted tooling state were represented in the project context.

Files Touched During July 23 Portfolio Work

- app/CaseDescription.tsx - added and then simplified the case description/eyebrow rendering path, preserving measured justified description rows while returning eyebrow text to natural left-aligned wrapping.
- app/ProofStats.tsx - new proof-stat label synchronizer that keeps all proof-stat labels in the same one-line, two-line, or three-line mode during responsive width changes.
- app/ProjectCarouselButton.tsx - exposed reusable project device/icon stack behavior, responsive asset-gap control, and case-card-compatible platform stack rendering.
- app/globals.css - refined case-card padding, top-row thirds, commit/worklog stats, title/device stack sizing, responsive device gaps, chip grids, screenshot scaling, hero phone screenshot containment, proof stat wrapping, Stack section columns, and case-grid breakpoints.
- app/layout.tsx - updated Portfolio page metadata and naming language where PrahL.dev branding needed to replace older wording.
- app/page.tsx - updated navigation, hero proof stats, case-study data, title variants, chip lists, 25-word descriptions, visible commit/worklog counts, PrahL.dev card title treatment, and the hero Credit King screenshot source.
- app/projects/alla-vostra/page.tsx - kept dedicated project-page visible copy aligned with the landing-page naming and count updates where user-visible project pages needed consistency.
- app/projects/cinerific/page.tsx - kept the Cinerific project page aligned with the landing-page naming and Portfolio branding updates without replacing its placeholder tablet-frame system.
- README.md - updated PrahL.dev/Prahlin project wording to match the current visible website identity.
- package.json, .github/hooks/prepare-commit-msg, and scripts/generate-commit-message.mjs - added local commit-message automation and the setup:commit-hook script after the public website pushes.
- portfolio_PROJECT_SNAPSHOT.txt - regenerated by ./read_project.sh for this worklog pass and left modified locally as a project-context artifact.
- portfolio_worklog_july23.pdf - generated as this daily Portfolio worklog artifact in the root-level Portfolio worklog convention.

Follow-Up Context

- The public website source is already represented by origin/main at 79c31b8, and the Hostinger static-export workflow has succeeded for that commit.
- The local commit-message automation, refreshed portfolio_PROJECT_SNAPSHOT.txt, and this July 23 PDF remain local until the user provides or approves a commit message for documentation/tooling artifact changes.
- Because this PDF increases the local Portfolio worklog count from 9 to 10, the PrahL.dev case-study card can be updated later if the user wants the public site to reflect the newly generated worklog count.
- Future case-study card changes should preserve the current title-row invariant: project names keep a shared left edge while device/icon stacks occupy the remaining row lane and close gaps only under severe compression.
- Future description edits should preserve the four explicit description lines and measured

CaseDescription behavior, because the equal row-count effect depends on those controlled text rows.

- Future eyebrow edits should preserve the top-row thirds model: left third for eyebrow text, right third for commit/worklog stats, and center space left open so the two groups do not collide.
- The global 1.0k+ Quality GitHub Commits proof stat remains a broad portfolio signal and should not be overwritten by per-card repository counts unless the user explicitly asks.
- The Stack section now intentionally keeps at least two columns per row even in narrow portrait layouts. If card contents grow later, cards should expand downward rather than returning to one-column behavior.
- Continue treating all future Portfolio work as local-only unless the user explicitly asks to commit, push, deploy, publish, or update the public website.

Output Artifact

- Generated file: portfolio_worklog_july23.pdf.
- Location: /Users/prahlin/gh/portfolio/portfolio_worklog_july23.pdf.
- Naming follows the existing root-level Portfolio convention: portfolio_worklog_july23.pdf. No part suffix was used because this is the first July 23 Portfolio worklog artifact.
- Uses the same daily worklog structure and compact technical voice established by portfolio_worklog_july11.pdf through portfolio_worklog_july22.pdf.
- Generated with a small standard-library PDF writer; no external PDF dependency was installed for this artifact.
- The local project date used for this filename and title is Thursday, July 23, 2026 EDT, matching the machine and repository work session clock.
